

ML Week 8

Number of participants: 31

1. Boosting

6 correct answers
out of 22 respondents

The idea of boosting can be used also with other methods than trees.

11 votes

Boosting works well for methods with high variance and small bias.

7 votes

Boosting has more tuning parameters than random forest.

17 votes

Boosting will attain zero training error for large B.

12 votes

2. The maximal margin classifier...

3 correct answers
out of 24 respondents

is a linear classification method.

79%

19 votes

has zero training error if it exists.

58%

14 votes

is generally applicable in practice.

17%

4 votes

is the best linear classifier if the training data is linearly separable.

67%

16 votes

3. Which of the following statement(s) hold(s)?

14 correct answers
out of 22 respondents

One can train tree boosting methods in parallel as the trees are independent.

0%

0 votes

The maximal margin classifier has no tuning parameters.

77%

17 votes

One can obtain a non-linear model by using boosting with linear models as weak learners.

36%
